

# Tabris.js printing support

Printing with Tabris.js can be achieved via `tabris.printer.print(<data>)`.

## Printing

Prints a PDF document using the native printing capabilities of the device. The data has to be provided as an `ArrayBuffer` or typed array. The method returns a promise which resolves to an event object with the property `result`. The `result` can either be `completed` or `canceled`. When printing fails the promise is rejected with an `Error` parameter containing additional information about the error. Supported on iOS and Android 4.4+.
